NEWS RELEASE

Starfire Minerals Inc. Starts Drilling on the Langmuir Nickel Prospect, Timmins, Ontario

Starfire Minerals Inc. announces that it has started drilling on its Langmuir nickel prospect in Timmins, Ontario, Canada. Drilling is focused initially on the southern extension of the Langmuir South nickel zone. According to historical reports in the area the Langmuir South zone contains 181,400 tons of nickel-bearing rocks grading 1.5% nickel. Of these, 100,000 tons is believed to occur on Starfire's property. For more information on Starfire's Langmuir property see Harron, 2005 available on SEDAR and on the company's website.

Drilling is designed to verify the presence of the previously documented sulphide zone and to explore for potential disseminated nickel in the host komatiites (ultramafic rocks). Disseminated nickel sulphide mineralization has been intersected on the Langmuir and Langmuir 2 properties immediately adjacent to the north by Inspiration Mining Company. Such disseminated zones were not of economic interest during historical exploration and were not pursued at that time.

Results of this program will be reported as available.

Compilation of historical data for all of Starfire's properties in this prospective nickel belt is underway with drilling to be scheduled as personnel and equipment permit. Once this phase of work is completed on the Langmuir site, Starfire intends to commence work on the nearby Carmen property.

The Qualified Person for purposes of this press release is Freeman Smith, P.Geo., Director, and Qualified Person.
